	1980	1981	1982	1983	1984	1985	1986	1987	1988	1989	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	2037	2038	2039	2040	2041	2042	2043	2044	2045	2046	2047	2048	2049	2050	2051	2052	2053	2054	2055	2056	2057	2058	2059	2060	2061	2062	2063	2064	2065	2066	2067	2068	2069	2070	2071	2072	2073	2074	2075	2076	2077	2078	2079	2080	2081	2082	2083	2084	2085	2086	2087	2088	2089	2090	2091	2092	2093	2094	2095	2096	2097	2098	2099	2100	2101	2102	2103	2104	2105	2106	2107	2108	2109	2110	2111	2112	2113	2114	2115	2116	2117	2118	2119	2120	2121	2122	2123	2124	2125	2126	2127	2128	2129	2130	2131	2132	2133	2134	2135	2136	2137	2138	2139	2140	2141	2142	2143	2144	2145	2146	2147	2148	2149	2150	2151	2152	2153	2154	2155	2156	2157	2158	2159	2160	2161	2162	2163	2164	2165	2166	2167	2168	2169	2170	2171	2172	2173	2174	2175	2176	2177	2178	2179	2180	2181	2182	2183	2184	2185	2186	2187	2188	2189	2190	2191	2192	2193	2194	2195	2196	2197	2198	2199	2200	2201	2202	2203	2204	2205	2206	2207	2208	2209	2210	2211	2212	2213	2214	2215	2216	2217	2218	2219	2220	2221	2222	2223	2224	2225	2226	2227	2228	2229	2230	2231	2232	2233	2234	2235	2236	2237	2238	2239	2240	2241	2242	2243	2244	2245	2246	2247	2248	2249	2250	2251	2252	2253	2254	2255	2256	2257	2258	2259	2260	2261	2262	2263	2264	2265	2266	2267	2268	2269	2270	2271	2272	2273	2274	2275	2276	2277	2278	2279	2280	2281	2282	2283	2284	2285	2286	2287	2288	2289	2290	2291	2292	2293	2294	2295	2296	2297	2298	2299	2300	2301	2302	2303	2304	2305	2306	2307	2308	2309	2310	2311	2312	2313	2314	2315	2316	2317	2318	2319	2320	2321	2322	2323	2324	2325	2326	2327	2328	2329	2330	2331	2332	2333	2334	2335	2336	2337	2338	2339	2340	2341	2342	2343	2344	2345	2346	2347	2348	2349	2350	2351	2352	2353	2354	2355	2356	2357	2358	2359	2360	2361	2362	2363	2364	2365	2366	2367	2368	2369	2370	2371	2372	2373	2374	2375	2376	2377	2378	2379	2380	2381	2382	2383	2384	2385	2386	2387	2388	2389	2390	2391	2392	2393	2394	2395	2396	2397	2398	2399	2400	2401	2402	2403	2404	2405	2406	2407	2408	2409	2410	2411	2412	2413	2414	2415	2416	2417	2418	2419	2420	2421	2422	2423	2424	2425	2426	2427	2428	2429	2430	2431	2432	2
--	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	---

The present invention relates to data management systems. More particularly, the present invention pertains to a method and system for organizing data (e.g., business metrics) defined by an analytic application.

Due to the increased amounts of data being stored and processed today, operational databases are constructed, categorized, and formatted for operational efficiency (e.g., throughput, processing speed, and storage capacity). Unfortunately, the raw data found in these operational databases often exist as rows and columns of numbers and code that appear bewildering and incomprehensible to business analysts and decision makers. Furthermore, the scope and vastness of the raw data stored in modern databases render it harder to analyze. Hence, "analytic applications" have been developed in an effort to help interpret, analyze, and compile the data so that it may be more readily understood by a business analyst. These applications map, sort, categorize and summarize the raw data before it is presented for display, so that individuals can interpret the data and use it as the basis for making decisions.

INFO-P011/JPH/WAZ

are relatively limited with respect to their user interface. That is, they lack full size keyboards and other familiar components, and as a result using them to search and move through large databases can be awkward and inefficient.

5 Similar difficulties are experienced when users try to search through large databases using conventional telephones to interact with an automated voice response system. Although a user can conduct a search using either voice commands or the buttons on a touch-tone phone, a search conducted in this manner is also awkward and inefficient.

10

Hence, it is desirable to facilitate access to information in the large databases defined by analytic applications, especially items of information of particular interest to a user. It is also desirable for the user to be able to access new information in a timely manner, without requiring the user to conduct
15 frequent and perhaps fruitless searches. Furthermore, it is desirable to accomplish the above using devices such as PDAs, cell phones, text pagers, and conventional telephones. The present invention provides a method and system that meet the above needs.

SUMMARY OF THE INVENTION

The present invention provides a method and system that can facilitate user access to information in the large databases defined by analytic applications, and that can allow the user to efficiently use his/her time to locate and access information of particular interest. The present invention also provides a method and system that can allow a user to access new information of particular interest in a timely manner. The present invention further provides a method and system that can accomplish these objectives using devices such as PDAs, cell phones, text pagers, and conventional telephones.

A method and system for organizing data to facilitate access to information defined by an analytic application are described. In particular, a taxonomy (hierarchy) for organizing the information and data (e.g., business metrics, transformed data, untransformed data, or raw data) is described. Users can also define their own hierarchies. The information and data are stored in a repository and categorized in a hierarchical organization navigable by users. A user can select certain instances of the data to create a customized list containing data of particular interest.

In one embodiment, termed the "pull" approach, the user can make selections from the customized list to access information of particular interest. The information so identified is provided to the user in response to a user's request.

In another embodiment, termed the "push" approach, information of particular interest can be automatically provided to the user, for example, at a prescribed frequency, when the information changes by a defined amount, or
5 when a certain threshold is reached. Alternatively, an alert can be provided to the user when, for example, the particular information of interest changes by a defined amount.

Thus, in accordance with the present invention, access to particular
10 information in the vast amount of information defined by an analytic application is facilitated, and new information of particular interest can be accessed in a timely manner.

BRIEF DESCRIPTION OF THE DRAWINGS

The accompanying drawings, which are incorporated in and form a part of this specification, illustrate embodiments of the present invention and, together with the description, serve to explain the principles of the invention.

5

Figure 1 is a block diagram of an exemplary computer system upon which embodiments of the present invention may be practiced.

Figure 2 is a block diagram depicting an exemplary system for wireless
10 delivery of data defined by an analytic application in accordance with one embodiment of the present invention.

Figure 3 illustrates an exemplary hierarchical organization for data
defined by an analytic application in accordance with one embodiment of the
15 present invention.

Figure 4 is a flowchart showing the steps in a process for organizing and accessing data defined by an analytic application in accordance with one embodiment of the present invention.

[illegible]

5

NOTATION AND NOMENCLATURE

15

computer system. It has proven convenient at times, principally for reasons of common usage, to refer to these signals as bits, values, elements, symbols, characters, terms, numbers, or the like.

5 It should be borne in mind, however, that all of these and similar terms are to be associated with the appropriate physical quantities and are merely convenient labels applied to these quantities. Unless specifically stated otherwise as apparent from the following discussions, it is appreciated that throughout the present invention, discussions utilizing terms such as
10 “generating,” “categorizing,” “receiving,” “sending” or the like, can refer to the actions and processes (e.g., process 400 of Figure 4) of a computer system or similar electronic computing device. The computer system or similar electronic computing device manipulates and transforms data represented as physical (electronic) quantities within the computer system’s registers and memories into
15 other data similarly represented as physical quantities within the computer system memories or registers or other such information storage, transmission, or display devices.

EXEMPLARY COMPUTER SYSTEM PLATFORM

20 With reference to Figure 1, portions of the present invention are comprised of the computer-readable and computer-executable instructions that reside, for example, in computer system 110 used as a part of a data warehousing system in accordance with one embodiment of the present

invention. It is appreciated that computer system 110 of Figure 1 is exemplary only and that the present invention can operate within a number of different computer systems including general-purpose computer systems, embedded computer systems, and stand-alone computer systems specially adapted for data warehousing applications.

In the present embodiment, computer system 110 includes an address/data bus 112 for conveying digital information between the various components, a central processor unit (CPU) 114 for processing the digital information and instructions, a volatile main memory 116 comprised of volatile random access memory (RAM) for storing the digital information and instructions, and a non-volatile read only memory (ROM) 118 for storing information and instructions of a more permanent nature. In addition, computer system 110 may also include a data storage unit 120 (e.g., a magnetic, optical, floppy, or tape drive or the like) for storing vast amounts of data. It should be noted that the software program for performing the transport process of the present invention can be stored either in volatile memory 116, data storage unit 120, or in an external storage device (not shown).

Devices which are optionally coupled to computer system 110 include a display device 128 for displaying information to a computer user, an alphanumeric input device 130 (e.g., a keyboard), and a cursor control device 126 (e.g., mouse, trackball, light pen, etc.) for inputting data, selections,

updates, etc. Computer system 110 also can include a mechanism for emitting an audible signal (not shown).

Furthermore, computer system 110 can include an input/output (I/O) signal unit (e.g., interface) 122 for interfacing with a peripheral device 135 (e.g., a computer network, modem, mass storage device, etc.). Accordingly, computer system 110 may be coupled in a network, such as in a client/server environment, whereby a number of clients (e.g., personal computers, workstations, portable computers, minicomputers, terminals, etc.) are used to run processes for performing desired tasks (e.g., inventory control, payroll, billing, etc.). In particular, computer system 110 can be coupled in a system for the delivery of data defined by an analytic application, exemplified by system 200 of Figure 2, below.

EXEMPLARY DATA DELIVERY SYSTEM

Figure 2 illustrates is a block diagram depicting one embodiment of a system 200 for the delivery of data, particularly the wireless delivery of data, in accordance with the present invention. Data sources 201 include one or more sources of operational data resulting from business and financial transactions, equipment performance logs, and the like. These data sources can based on and formatted according to a Relational Database Management System (RDBMS) (such as from Oracle, Informix, Sybase, Microsoft, etc.), an Enterprise Resource Planning (ERP) system, Service Advertising Protocol (SAP), flat files,

and other data transmission formats, either planned or envisioned, including XML, WML, HDML, HTML, and I-mode HTML.

5 Data storage 202 is for storing operational data and the like from data sources 201, typically using a high capacity mass storage device (such as hard disk drives, optical drives, tape drives, etc.). In one embodiment, data storage 202 is a data warehouse. Data storage 202 is coupled to a database management system (DBMS) 204 by analytic data interface 203. DBMS 204 executes an analytic application such as a data mart application. A repository
10 205 is coupled to (or integrated with) DBMS 204 for storing information from the database management system.

In one embodiment, data are generated using a process such as the Transformation Definition Language (TDL) process described in US Patent No.
15 6,014,670, assigned to the assignee of the present invention and hereby incorporated by reference. There are at least three styles of calculating data (e.g., business metrics): periodic, on demand, and continuous (real time). In the periodic style, data are calculated at predetermined intervals (e.g., hourly, daily, weekly, etc.) and stored in repository 205, and the most recent data are
20 provided to the requester. In the on demand style, the data are calculated in response to a user request. These data may be cached or persisted in some manner (e.g., in repository 205), but do not exist or have value until they are initially requested. In the continuous (real time) style, data are updated as

underlying data are updated. For example, a business metric describing the moving average for the inventory of a particular item gets updated as the inventory level for that item is updated. In each case, the requester gets the freshest data.

5

It is appreciated that business metrics can include any number of either the commonly used metrics for measuring business performance and efficiency, or unique business metrics defined by a user of an analytic application.

Business metrics include, but are not limited to, measures of account
10 receivables, account payables, general ledger, and cash flow. Metrics for account receivables can include, but are not limited to: account receivable balances, account receivable transactions, quality of sales, receivables-to-sales ratio, average collection period, customer credit reports, days outstanding, ratio of cash receipts to billed sales and payments in progress, ratio between ending
15 accounts receivables balance and sum of billed sales, progress payments and beginning balances, ratio of ending receivables balance to cash receipts, account receivables turnover, average receivables amount, aging receivables by period, day of sales in receivables ratio, and current period collection rate. Metrics for account payables can include, but are not limited to: account
20 payables balances, account payables transactions, quality of purchase, account payables turnover ratio, disbursements-to-payables ratio, days outstanding, payables-to-purchase ratio, average payment period, vendor credit analysis, ratio of cash disbursements to invoiced receipts, ratio between ending accounts

payables balance and sum of incoming invoiced amounts, progress payments and beginning balances, ratio of ending payables balance to cash disbursements, payables-to-sales ratio, average payables amount, aging payables by period, day of purchase in payables ratio, and current period payment rate. General ledger metrics can include, but are not limited to: account balances, balance sheet plus profit/loss statement, revenues, costs, gross margins, and net profits. Cash flow metrics can include, but are not limited to: projected cash flow from receivables, cash flow from operations, and cash on hand.

10

Returning to Figure 2, in the present embodiment, an application server 206 is interposed between the DBMS 204 and a voice server 207 or the Internet 209. Application server 206 is exemplified by computer system 110 of Figure 1. Application server 206 may incorporate DBMS 204 and repository 205, or these may be separate entities.

15

In one embodiment, application server 206 of Figure 2 is accessible to users via a unique Uniform Resource Locator (URL). According to either a push or pull approach for data delivery, as described more fully below, application server 206 provides information (e.g., business metrics and transformed data, but also untransformed or raw data) to users from DBMS 204 and/or repository 205.

20

1 Voice server 207 provides voice-to-text and text-to-voice services for
converting voice messages received from a user via a conventional telephone
210, and for similarly converting information from application server 206 into an
audible message. A user can thereby access application server 206 using a
5 conventional telephone 210 via voice server 207, and receive information from
application server 206 via the same path. For security purposes, a firewall 208
encloses voice server 207, application server 206 and the other devices and
components coupled with those devices on the internal side of the firewall.

10 Wireless gateway 211 enables communication between wireless devices
and application server 206 within the framework of a wireless service provider
(WSP). Wireless devices are exemplified as wireless phone 212 and PDA 213;
however, it is appreciated that other types of wireless devices such as a pager
or two-way pager, or any other data-capable or data-enabled device operable
15 for wireless communication, may be used. Preferably, the wireless devices
have display capability, but other means for conveying information to a user
may be utilized. For example, information can be converted into an audible
message (e.g., text-to-voice) as part of an automated voice response system.

20 Coupled to the Internet 209 may be a computer system 214 that is also
capable of communicating with application server 206. For example,
information can be exchanged between computer system 214 and application
server 206 via electronic mail (e-mail). Computer system 214 may also

incorporate a Web browser or other such elements allowing it to access a Web site on application server 206 using the URL for application server 206.

In summary, system 200 supports a number of various different types of end-user devices, as well as different types of service providers (e.g., Internet Service Providers, WSPs, etc.). In accordance with the present invention, a user can register a variety of devices and device types utilizing different service providers, protocols, communication standards, and data formats, and use these devices to receive information (e.g., business metrics, etc.) at remote locations (e.g., at field locations worldwide).

TAXONOMY OF INFORMATION DEFINED BY ANALYTIC APPLICATIONS

Figure 3 illustrates an exemplary hierarchical organization 295 (e.g., a taxonomy) used to organize data (e.g., business metrics, transformed data, untransformed data, or raw data) and information defined by an analytic application in accordance with one embodiment of the present invention. In one embodiment, the hierarchical organization 295 is applied to the information stored in a database (e.g., repository 205 of Figure 2). In another embodiment, the hierarchical organization 295 is applied to a taxonomy of business metrics, transformed data, untransformed data, or raw data. That is, as described above, there are at least three styles for calculating business metrics: periodic, on demand, and continuous (real time). Thus, hierarchical organization 295 can be used to navigate through calculated data stored in repository 205, or it can be

used to navigate through a taxonomy of data that are not processed until the user makes a request for a particular instance of data.

In one embodiment, a user accessing hierarchical organization 295 is presented with a top-level menu. As described above, the user can accomplish this using a PDA, a cell phone, a text pager, a conventional telephone, a conventional desktop computer system, or any other data-capable or data-enabled device operable for wireless communication.

10 In accordance with the present invention, the user can navigate through hierarchical organization 295 by selecting an item from the top-level menu (e.g., either "purchasing" or "customer relations"), and then by making further selections at each subsequent level in hierarchical organization 295. For example, after selecting "customer relations," a user can then select "sales" or
15 "marketing." A user can move backwards or forwards (up or down) in hierarchical organization 295; that is, from "customer relations," a user can move to the top-level menu or to either "sales" or "marketing."

In one embodiment, hierarchical organization 295 is a standardized (or
20 fixed) taxonomy defined by an administrator of system 200 (Figure 2), for example. In another embodiment, hierarchical organization 295 is customized by and/or for each user. In the latter embodiment, each user selects information (e.g., business metrics, transformed data, untransformed data, or raw data) of

particular interest and creates their own unique taxonomies. For example, a user can select "total sales (current fiscal year)" from hierarchical organization 295 and include this in a user-specific taxonomy. Consequently, the user does not need to subsequently navigate through hierarchical organization 295 to
 5 access this information, and instead can access this information directly in the user-specific taxonomy. The present invention thus provides a method and system that can facilitate user access to information (e.g., business metrics, transformed data, untransformed data, or raw data) defined by an analytic application, and that can allow the user to efficiently use his/her time to locate
 10 and access information of particular interest.

It is appreciated that hierarchical organization 295 can be arbitrarily deep or broad (e.g., any number of levels, and any number of entries at each level), and that multiple different taxonomies can be associated with a single analytic
 15 application. Thus, different types of users can each use independent taxonomies; for example, a first taxonomy may be specifically designed for a particular job function, and a second taxonomy for another job function. In addition, one hierarchical organization 295 may refer to another (e.g., a node in one taxonomy may be linked to a node in another).

20

It is also appreciated that, although in the preferred embodiment the information in hierarchical organization 295 pertains to information defined by an analytic application (e.g., business metrics, transformed data, untransformed

data, or raw data), the present invention can also be used for unstructured data such as news feeds and the like.

It is further appreciated that, although hierarchical organization 295 is shown in Figure 3 as having one "parent" for each entry in a level, in fact there may be multiple parents for an entry. That is, "total sales" is shown as depending from "sales;" in actuality, "total sales" may depend from many other parents, and in turn may be the parent for multiple entries at a lower level in hierarchical organization 295. Thus, in accordance with the present invention, a user may operate further on information found through navigation of hierarchical organization 295. That is, a user may reach a particular business metric by following one "path" through hierarchical organization 295, but can leave that business metric by a different path, either back up hierarchical organization 295 or to a level deeper in hierarchical organization 295.

In one embodiment, the information in hierarchical organization 295 is provided in response to user-initiated actions (termed a "pull" approach). That is, the user can navigate through hierarchical organization 295, select an item of information, and be provided with data in response to the selection.

In another embodiment (termed a "push" approach), a user can instead specify a frequency with which to receive data (e.g., business metrics) of interest; the information is provided to the user at the frequency specified (e.g.,

hourly, daily, weekly, etc.). In another embodiment of the push approach, a user can specify that data (e.g., business metrics) of interest are to be displayed when they change from a previous value. In this embodiment, the user can also specify thresholds or conditions under which they should be notified of a

5 change in the data of interest. For example, the user can specify that if a metric changes by a certain amount, or by a certain percentage, then that metric should be provided. Similarly, in another embodiment, the user can be alerted to a significant change in the data of interest. That is, instead of the metric being displayed, an audio or visual signal detectable by the user can be made.

10 The present invention thus provides a method and system that can allow a user to access new information of particular interest in a timely manner, without the user having to continually check to see if the information has changed significantly. The hierarchical organization 295 particularly lends itself

15 to wireless access. The capability for a user to input instructions using a wireless device (e.g., wireless phone 212 and PDA 213 of Figure 2, or a similar type of device) may be limited in comparison to a conventional computer system. The amount of data that can be sent to a wireless device may also be comparatively limited, and the amount of time that a user can remain connected

20 to application server 206 (Figure 2) may be limited as well. However, in accordance with the present invention, a user can more readily locate and access particular information of interest defined by an analytic application, and

as such the present invention makes remote (wireless) access a viable alternative.

5 The present invention also provides a framework for the delivery of information (e.g., business metrics) via an automated voice response system. The user can request data using voice commands or by naming each level in hierarchical organization 295 until the user reaches the point in the taxonomy of interest. Furthermore, the taxonomy can be read to the user utilizing a text-to-speech system, thereby allowing the user to receive data even if the user is not
10 familiar with the taxonomy of hierarchical organization 295.

Additional information regarding wireless delivery of business metrics, the push approach, and the pull approach is provided in the co-pending U.S. Patent Application entitled "Method and System for the Wireless Delivery of
15 Transformed Data," Attorney Docket Number INFO-P010, with Serial Number _____ and filing date _____, assigned to the assignee of the present invention and hereby incorporated by reference.

Figure 4 is a flowchart showing the steps in a process 400 for organizing
20 and accessing data (including business metrics, transformed data, untransformed data, and raw data) defined by an analytic application in accordance with one embodiment of the present invention. Process 400 can be implemented via computer-readable program instructions stored in a memory

unit (e.g., volatile memory 116, non-volatile memory 118, and/or data storage unit 120) and executed by processor 114 of computer system 110 (Figure 1). However, it is appreciated that portions of process 400 can be implemented on different computer systems that are communicatively linked in a computer system network. It is also understood that each of the steps in process 400 are optional depending on the particular information needs of the user. In addition, it is understood that the steps in process 400 can be performed in a different order, or that they can be repeated as necessary.

10 In step 410 of Figure 4, in the present embodiment, operational data are received from a source (e.g., data sources 201 of Figure 2).

15 In step 420 of Figure 4, metrics are generated using an analytic application such as the TDL process described in the above-referenced US Patent No. 6,014,670. As described above, there are at least three styles of data and data generation: periodic, on demand, and continuous (real time). The metrics may be generated dynamically, in which case they can be provided to a user without being stored in a database, for example. Alternatively, the metrics may be generated and stored in a database (e.g., repository 205 of Figure 2).

In step 430 of Figure 4, in the present embodiment, information defined by an analytic application is categorized according to a hierarchical

organization (taxonomy) such as that shown by Figure 3. The hierarchical organization can be defined by the user, or by the designer or administrator of system 200. The hierarchical organization can also be established automatically by grouping similar types of data (e.g., account receivables, account payables, etc.), or by grouping the data by vendor, customer, department or the like.

In step 440 of Figure 4, in one embodiment, a user can subsequently select one or more of the instances of information using hierarchical organization 295. As described above in step 420, the data corresponding to the user's selection can be retrieved from repository 205 if the data exist, or the data can be generated in response to the user's selection.

In step 450 of Figure 4, data responsive to the user's selection are transmitted to the user's device (e.g., telephone 210, wireless phone 212, PDA 213 or computer system 214 of Figure 2).

In summary, the present invention provides a method and system that can facilitate user access to information in the large databases defined by analytic applications, and that can allow the user to efficiently use his/her time to locate and access information of particular interest. The present invention also provides a method and system that can allow a user to access new information of particular interest in a timely manner. The present invention further provides
